

ACKNOWLEDGEMENTS

I wish to express my deep gratitude to my supervisors Dr. I. Philippaki-Warburton and Dr. P. Fletcher, to whom I am indebted more than can be acknowledged here for their invaluable and generous advice and comments on both the substance and manner of presentation of this thesis, as well as for their constant encouragement. I also gratefully acknowledge the enthusiasm and patience with which A. Hughes offered me his precious advice and guidance mainly on matters related to the collection and analysis of the data-base of this study during the first two years of my research, when he supervised my work together with Dr. I. Philippaki-Warburton.

It gives me great pleasure to record here my thanks to Dr. A. Woods of the Applied Statistics Department for his interest in my work and his thorough instructions concerning the sampling of my data and the statistical analysis and presentation of my findings. I would also like to thank K. Freeman for his generous help in programming my computer work.

I have to extend my thanks to Dr. Melita Stavrou for many discussions I had with her and for her useful comments on some of my examples in the section on Agentivity. My thanks must also be directed to the librarians Miss E. Apaki and Miss K. Apaki, as well as to Mr. G. Sarigiannis and Mr. I. Papalexis, who were in charge of the journal Diavazo, for their assistance in selecting and having access to the texts I included in my material.

A word of public thanks also goes to my parents and my aunt Kiki Typaldou-Lascaratou, whose support and encouragement were invaluable during the five years of my post-graduate studies.
